

# Thermographic inspection

## Process systems survey

### Would you like to increase the operational stability and save on your maintenance budget?

Thermographic inspection lets you do exactly that, by immediately uncovering safety hazards and production bottlenecks.

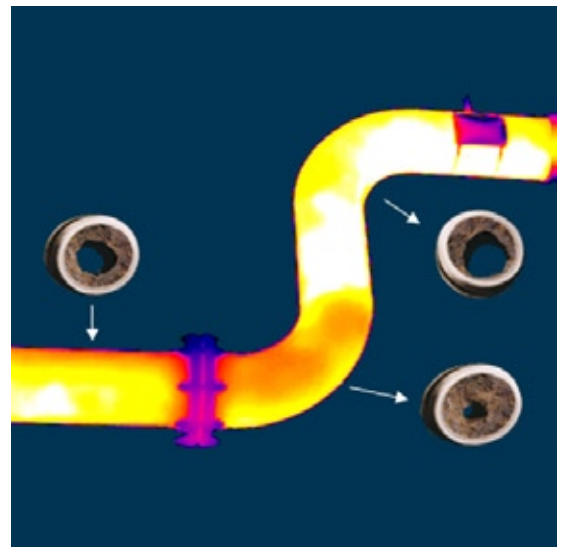

### Typical scope of work

- Accurate scale and deposit quantification
- Cross section representation of findings
- Choke effect calculation
- Amount compared to previous inspections (Trending)
- Detailed report of findings

Other application includes detection of deposits and levels in separators and tanks, flagging of areas with risk of erosion, shut down assistance, optimization of chemical use, CUI and more

A process systems survey should be performed previous to planned shutdown to determine the scope of work.

We have performed world wide thermographic inspections both onshore and offshore since 1991.
